

# Some New Complexity Bounds for Real Fewnomials

J. Maurice Rojas\* (Texas A&M University)

April 13, 2004

\* Partially supported by NSF grants DMS-0211458 and DMS-0138446.

# OUTLINE

1. **Sharpening Khovanski's Real Fewnomial Theorem** [Li, Rojas, Wang: Disc. & Comp. Geom. 2003]
2. **A clearer boundary to NP-hardness for fewnomials** [Rojas, Stella]
3. **Breaking a complexity barrier for counting and approximating the roots of certain fewnomial systems**  
[Rojas, Ye: J. of Complexity, 2004 ]

# APPLICATIONS OVER $\mathbb{R}$

## Rational Drug Design...

$n$  twist angles  $\implies 3n$  equations in  $3n$  unknowns...

# MORE APPLICATIONS OVER $\mathbb{R}$

- **Dynamical Systems:** Arnold's linearized version of Hilbert's 16th Problem [Khovanski, Varchenko 1984].
- **Torsion Points on Algebraic Curves:** Given any number field  $K$ , there is an explicit upper bound for the number of  $x \in K \setminus \{0, 1\}$  satisfying  $x^a(1-x)^b = 1$  for some  $(a, b) \in \mathbb{Z}^2$  [Cohen & Zannier, 2002].
- **Geometric Model Theory:** Model Completeness and o-minimality for the first order theory of  $\langle \mathbb{R}, +, \cdot, -, 0, 1, \exp, < \rangle$  [Wilkie, 1996]

# SHARPENING FEYNOMIAL THEORY / $\mathbb{R}$

**Main Theorem 1** Consider...

$$c_{1,0}x^{a_0} + \dots + c_{1,n}x^{a_n}$$

$\vdots$

$$c_{n-1,0}x^{a_0} + \dots + c_{n-1,n}x^{a_n}$$

$$c_{n,1}x^{b_1} + \dots + c_{n,m}x^{b_m}$$

etc...

Any  $m$   
points

$n-1$

# SHARPENING FEWNOMIAL THEORY / $\mathbb{R}$

**Main Theorem 1** [Li-Rojas-Wang, DCG 2003]

$$\begin{aligned} & c_{1,0}x^{a_0} + \cdots + c_{1,n}x^{a_n} \\ & \quad \vdots \\ & c_{n-1,0}x^{a_0} + \cdots + c_{n-1,n}x^{a_n} \\ & c_{n,1}x^{b_1} + \cdots + c_{n,m}x^{b_m} \end{aligned}$$

has  $\leq \boxed{\frac{n^m - n}{n-1}}$  isolated roots in  $\mathbb{R}_+^n$ , where  $c_{i,j} \in \mathbb{R}$ ,  $a_i, b_i \in \mathbb{R}^n$  (the  $a_i$  affinely independent), and  $Z_+(f_1, \dots, f_{n-1})$  smooth. Moreover...

when  $(m, n) = (3, 2)$ , the maximum number is exactly 5. ■

# COMPARISON $/\mathbb{R}$

[Khovanski, 1980+ $\varepsilon$ ] Suppose  $f_1, \dots, f_n \in \mathbb{R}[x^a \mid a \in \mathbb{R}^n]$  have a total of  $\mu$  distinct exponent vectors in their monomial term expansions. Then  $F := (f_1, \dots, f_n)$  has  $\leq (n+1)^{\mu-1} 2^{(\mu-1)(\mu-2)/2}$  non-degenerate roots in  $\mathbb{R}_+^n$ .

# COMPARISON $/\mathbb{R}$

[Khovanski, 1980 $+\varepsilon$ ] Suppose  $f_1, \dots, f_n \in \mathbb{R}[x^a \mid a \in \mathbb{R}^n]$  have a total of  $\mu$  distinct exponent vectors in their monomial term expansions. Then  $F := (f_1, \dots, f_n)$  has  $\leq (n+1)^{\mu-1} 2^{(\mu-1)(\mu-2)/2}$  non-degenerate roots in  $\mathbb{R}_+^n$ .

**Example 1:** In the setting of Main Theorem 2,  $\mu = m + n$  and Khovanski's bound is  $2^{\Theta((m+n)^2)} \gg \Theta(n^{m-1})$ . So we get the first non-trivial improvement — a factor exponential in  $n$  — in close to 20 years.

# COMPARISON $/\mathbb{R}$

[Khovanski, 1980 $+\varepsilon$ ] Suppose  $f_1, \dots, f_n \in \mathbb{R}[x^a \mid a \in \mathbb{R}^n]$  have a total of  $\mu$  distinct exponent vectors in their monomial term expansions. Then  $F := (f_1, \dots, f_n)$  has  $\leq (n+1)^{\mu-1} 2^{(\mu-1)(\mu-2)/2}$  non-degenerate roots in  $\mathbb{R}_+^n$ .

**Example 1:** In the setting of Main Theorem 2,  $\mu = m + n$  and Khovanski's bound is  $2^{\Theta((m+n)^2)} \gg \Theta(n^{m-1})$ . So we get the first non-trivial improvement — a factor exponential in  $n$  — in close to 20 years.

**Example 2:** For 2 general **trinomials**, Khovanski's bound is **5184**, while the correct tight bound is **5**.

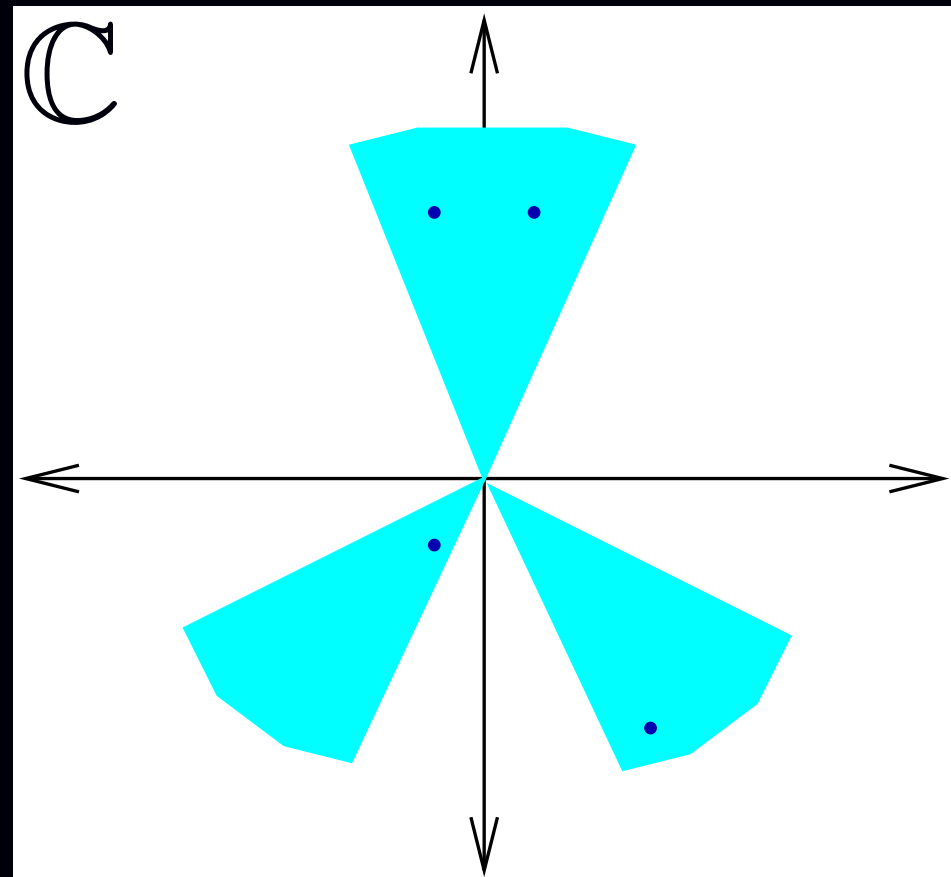

# CONJECTURE

The maximal number of **isolated** roots in  $\mathbb{R}_+^n$  of a  **$\mu$ -sparse  $n \times n$**  fewnomial system is  $\mu^{O(n)}$ .

“Meta”-Evidence: The analogue over  $\mathbb{Q}_p$  is true! [Rojas, AJM 2004]

# $\mathbb{C}$ , $\mathbb{C}_p$ , AND THE METAPHOR OF ANGLE

...curious reversal of real case: Khovanski extended his results to counting roots in an angular sector.

$n = 1$ : [Marc Voorhoeve, 1977]

# 1000 RANDOM TETRANOMIALS

$a + bx^6 + cx^{10} + dx^{31}$   
with  $a, b, c, d$  real  
indep. centered  
Gaussians

Deviation from  
average number  
in a sector is  
very small...

# DECIDING EXISTENCE...

## Main Theorem 2 [Rojas-Stella, 2004]

For a  $\mu$ -nomial  $f \in \mathbb{Z}[x_1, \dots, x_n]$ , deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  is...

1. NP-hard for  $\mu \geq 6(n + 1)$ .
2. in P for  $\mu \leq n + 1$  (generic exponents).

# DECIDING EXISTENCE...

## Main Theorem 2 [Rojas-Stella, 2004]

For a  $\mu$ -nomial  $f \in \mathbb{Z}[x_1, \dots, x_n]$ , deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  is...

1. NP-hard for  $\mu \geq 6(n + 1)$ .
2. in P for  $\mu \leq n + 1$  (generic exponents).

E.g.,  $\text{size}(7x^D - 999y^{37} + 234xy^{12}z) = \Theta(\log D)$ , and...

$\text{size}(\text{General Degree } D \text{ Polynomial}) = O(D^n \log D) \text{MaxBitSize}(\text{Coeff of } f)$

# DECIDING EXISTENCE...

## Main Theorem 2 [Rojas-Stella, 2004]

For a  $\mu$ -nomial  $f \in \mathbb{Z}[x_1, \dots, x_n]$ , deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  is...

1. NP-hard for  $\mu \geq 6(n + 1)$ .
2. in P for  $\mu \leq n + 1$  (generic exponents).

$\text{size}(f) := \#$  of bits to write monomial term expansion

High degree is OK!

# BEST EARLIER WORK?

1. Deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  for a  $\mu$ -nomial  $f \in \mathbb{Z}[x_1, \dots, x_n]$  is **NP-hard** for  $\mu \geq \frac{13}{3}n^3 - 13n^2 + \frac{26}{3}n + 1$  [Anon, 1980's].  
(Fixed  $n$  still open, even for  $n=1$ !)

2. ...

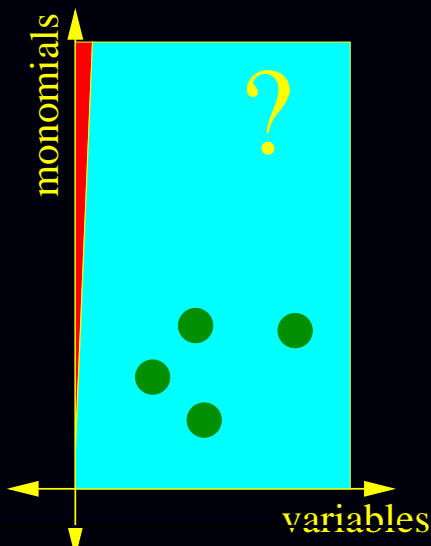

# BEST EARLIER WORK?

1. Deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  for a  $\mu$ -nomial  $f \in \mathbb{Z}[x_1, \dots, x_n]$  is NP-hard for  $\mu \geq \frac{13}{3}n^3 - 13n^2 + \frac{26}{3}n + 1$  [Anon, 1980's].  
(Fixed  $n$  still open, even for  $n=1$ !)
2. Deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  for a quadratic  $f \in \mathbb{Z}[x_1, \dots, x_n]$  is in P. (A special case of  $\mu = O(n^2)$ ...)  
[Barvinok, 1990's; Grigoriev-deKlerk-Pasechnik, 2002]

# BEST EARLIER WORK?

1. Deciding  $Z_{\mathbb{R}}(f) \stackrel{?}{=} \emptyset$  for a  $\mu$ -nomial  $f \in \mathbb{Z}[x_1, \dots, x_n]$  is NP-hard for  $\mu \geq \frac{13}{3}n^3 - 13n^2 + \frac{26}{3}n + 1$  [Anon, 1980's].  
(Fixed  $n$  still open, even for  $n=1$ !)

# COUNTING AND SOLVING?

Main Theorem 3 For any  $\mu$ -nomial  $f \in \mathbb{R}[x_1]$ , of degree  $D$ , we can do the following:

1. With probability  $\geq 1 - \varepsilon$ , count exactly the number of real roots of  $f$ , using just  $O\left(\frac{1}{\varepsilon}\mu \log D\right)$  arithmetic operations. Furthermore, for  $\mu \leq 3$ ,  $O(\log^2 D)$  suffices for an **exact** count.

2. ...

# COUNTING AND SOLVING?

Main Theorem 3 For any  $\mu$ -nomial  $f \in \mathbb{R}[x_1]$ , of degree  $D$ , we can do the following:

1. With probability  $\geq 1 - \varepsilon$ , count exactly the number of real roots of  $f$ , using just  $O(\frac{1}{\varepsilon} \mu \log D)$  arithmetic operations. Furthermore, for  $\mu \leq 3$ ,  $O(\log^2 D)$  suffices for an exact count.
2. [Rojas-Ye, J. of Complexity, 2004]  $\varepsilon$ -approximate all the roots in  $[0, R]$  of a trinomial, using just  $O(\log(D) \log(D \log \frac{R}{\varepsilon}))$  arithmetic operations. ■

# BEST EARLIER WORK?

1. Counting the number of roots in  $[0, R]$  for a general  $f \in \mathbb{R}[x_1]$  of degree  $D$  takes  $\Omega(D \log D)$  arithmetic operations [Lickteig & Roy, 2000], and evaluating already requires  $\Omega(m \log D)$ .

2. ...

# BEST EARLIER WORK?

1. Counting the number of roots in  $[0, R]$  for a general  $f \in \mathbb{R}[x_1]$  of degree  $D$  takes  $\Omega(D \log D)$  arithmetic operations [Lickteig & Roy, 2000], and evaluating already requires  $\Omega(m \log D)$ .

2.  $\varepsilon$ -approximating all the roots in  $\{z \in \mathbb{C} \mid |z| \leq R\}$  of a general  $f \in \mathbb{C}[x_1]$  of degree  $D$  can be done using just  $O(D \log^5 D \log \log \frac{R}{\varepsilon})$  arithmetic operations [Neff, Reif, 1996]...

# BEST EARLIER WORK?

1. Counting the number of roots in  $[0, R]$  for a general  $f \in \mathbb{R}[x_1]$  of degree  $D$  takes  $\Omega(D \log D)$  arithmetic operations [Lickteig & Roy, 2000], and evaluating already requires  $\Omega(m \log D)$ .

2. ...and approximating square roots within  $\varepsilon$  already requires at least  $\Omega(\log \log \frac{1}{\varepsilon})$  arithmetic operations [Bshouty, Mansour, Schieber, & Tiwari, 1997].
